

Restful-Booker API

Bug Summary Report

Field	Detail
Project	Restful-Booker API Testing
Base URL	https://restful-booker.herokuapp.com
Report Date	July 18, 2026
Prepared By	QA / API Test Engineer
Reference Documents	Test Case Log, Defect Log

1. Executive Summary

This report summarizes the results of functional API testing performed against the Restful-Booker service. A total of 13 test cases were executed across the service's core endpoints, covering health check, authentication, and full lifecycle management of Booking records. Of these, 11 test cases passed and 2 failed, yielding a pass rate of 84.6%. Two defects were logged as a result of the failed test cases, both of which remain open at the time of this report.

2. Test Execution Summary

Metric	Value
Total Test Cases Executed	13
Passed	11
Failed	2
Pass Rate	84.6%
Defects Logged	2
Defects Open	2
Defects Closed	0

2.1 Results by Endpoint

Endpoint	Method	Test ID	Result
/ping	GET	TC-01	Pass
/auth	POST	TC-02	Pass
/auth	POST	TC-03	Pass
/booking	POST	TC-04	Pass

/booking	POST	TC-05	Pass
/booking/{id}	GET	TC-06	Pass
/booking/{id}	GET	TC-07	Pass
/booking/{id}	PUT	TC-08	Pass
/booking/{id}	PUT	TC-09	Pass
/booking/{id}	PATCH	TC-10	Pass
/booking/{id}	DELETE	TC-11	Fail
/booking/{id}	GET	TC-12	Pass
/booking	GET	TC-13	Fail

3. Defect Summary

Two defects were identified during test execution. Both remain in Open status.

Defect ID	Severity	Status
BUG-01	Low	Open
BUG-02	Medium	Open

3.1 Severity Breakdown

Severity	Count
Critical	0
High	0
Medium	1
Low	1

4. Defect Details

4.1 BUG-01 — DELETE returns 201 Created instead of 204 No Content

Field	Detail
Defect ID	BUG-01
Related Test Case	TC-11
Endpoint	DELETE /booking/{id}
Severity	Low
Status	Open
Date Found	2026-07-15
Expected Behavior	204 No Content returned on successful delete
Actual Behavior	201 Created returned
Description	The DELETE endpoint returns HTTP 201 Created instead of the conventional HTTP 204 No Content upon successful deletion of a Booking record. The delete operation itself completes successfully; only the returned status code deviates from standard REST conventions.
Impact	Low. Automated test assertions that strictly check for 204 will fail unless this behavior is explicitly accounted for. No data integrity or functional impact was observed.
Recommendation	Update API documentation to reflect the actual status code, or align the endpoint's response with standard REST conventions (204 No Content) if this was not an intentional design decision.

4.2 BUG-02 — Filtered booking search returns a non-matching result

Field	Detail
Defect ID	BUG-02
Related Test Case	TC-13
Endpoint	GET /booking?firstname=Sally&lastname=Brown
Severity	Medium
Status	Open
Date Found	2026-07-15
Expected Behavior	Returns an array of booking IDs matching the supplied firstname and lastname filters
Actual Behavior	The returned booking ID does not correspond to a record matching the requested name filters

Description	When querying the collection endpoint with firstname and lastname filters, the service returns a result set containing at least one booking ID whose underlying record does not match the supplied filter criteria. This indicates the filtering logic on the server may not be correctly matching against both fields, or is returning results based on partial or incorrect matching.
Impact	Medium. Consumers relying on this endpoint to retrieve accurate filtered results may receive incorrect data, which could affect any downstream logic dependent on accurate search results.
Recommendation	Verify server-side filter logic for the firstname and lastname query parameters. Re-test with a broader set of filter combinations to determine whether the issue is isolated to specific inputs or systemic.

5. Conclusion and Recommendations

- Overall API stability is good, with 84.6% of executed test cases passing without issue.
- BUG-01 is cosmetic in nature and low risk; it is recommended primarily as a documentation correction.
- BUG-02 warrants further investigation, as inaccurate filtering results carry a higher functional risk than a status code mismatch.
- It is recommended that both defects be retested following any remediation, and that additional boundary and negative test cases be added around the query-filtering functionality of the GET /booking endpoint.
