

DEFECT SUMMARY REPORT

Swag Labs E-Commerce Web Application

(Sauce Demo-style Storefront) — Test Cycle 1

Prepared by: Augustine (Independent QA Tester)

Date: July 15, 2026

Overall Status: 8 of 8 defects OPEN — Release NOT Recommended

1. Report Overview

This report summarizes the defects identified during manual functional testing of the Swag Labs storefront (Products, Product Detail, Cart, Checkout, and cross-page UI). It is based on execution of the project's test case suite and the resulting defect log, and is intended to give a clear, evidence-based picture of product quality and release readiness at the end of this test cycle.

2. Test Execution Summary

Module	Total Test Cases	Positive	Negative
Product Listing	11	11	0
Product Detail	4	4	0
Cart	8	7	1
Checkout Info	13	6	7
Cross-Page UI	6	6	0
Non-Functional	2	1	1
TOTAL	44	35	9

Of the 44 test cases recorded, 8 defects were logged against failing checks, giving an estimated pass rate of 81.8% and a fail rate of 18.2% for this cycle. This assumes one defect per distinct failure; it is not a precise 1:1 mapping and should be cross-checked against the individual test case results when available.

3. Defect Overview

3.1 By Severity

Severity	Count	% of Total
High	4	50%
Medium	3	38%
Low	1	13%
Total	8	100%

3.2 By Priority

Priority	Count	% of Total
High	4	50%
Medium	4	50%
Low	0	0%

3.3 By Status

All 8 logged defects are currently in Open status — none have moved to In Progress, Fixed, or Closed. No retesting has occurred yet this cycle.

3.4 By Module

Module	Defects	Test Cases	Defect Rate
Product Listing	2	11	18.2%
Product Detail	1	4	25.0%
Cart	1	8	12.5%
Checkout Info	3	13	23.1%
Cross-Page UI	1	6	16.7%
Non-Functional	0	2	0.0%

Checkout Info and Product Detail show the highest defect rates (23.1% and 25.0% respectively), followed closely by Product Listing (18.2%). These three modules cover the entire core purchase path — browse, add to cart, and check out — so their defect concentration is the main driver of this cycle's overall risk.

4. Detailed Defect Log

Bug ID	Module	Description	Severity	Status
SWG_BUG_001	Product Listing	'Add to Cart' is non-functional for specific products; cart badge and button state don't update on click.	High	Open
SWG_BUG_002	Product Listing	'Remove' button is unclickable after adding an item; item stays in cart, badge count doesn't decrease.	High	Open
SWG_BUG_003	Product Detail	'Add to Cart' on the product detail page is non-functional for specific products; badge/button do not update.	High	Open
SWG_BUG_004	Cart	Checkout is reachable from an empty cart; user proceeds to Checkout: Your Information without an empty-order warning.	Medium	Open
SWG_BUG_005	Checkout Info	Form accepts submission with Last Name left blank; no inline validation error is shown.	Medium	Open
SWG_BUG_006	Checkout Info	'Cancel' navigates to the Products page instead of the Cart page (cart contents are preserved, but destination is wrong).	Low	Open
SWG_BUG_007	Checkout Info	'Finish' button does not respond; order is never submitted and no confirmation is shown.	High	Open
SWG_BUG_008	Cross-Page UI	'Terms of Service' and 'Privacy Policy' footer text are not functional links.	Medium	Open

5. Critical Findings — Core Purchase Flow at Risk

Four of the eight open defects are High severity, and together they break the shopper's ability to complete a purchase at all:

- SWG_BUG_001 / SWG_BUG_003 — Add to Cart fails silently for specific products on both the Listing and Detail pages, so those items can never enter the cart.
- SWG_BUG_002 — Remove is unresponsive for items that were successfully added, trapping items in the cart with no way to undo the action.
- SWG_BUG_007 — The Finish button on checkout does not respond, so no order can ever be completed — this is a full stop on the primary business flow (revenue-blocking).

Taken together, these four defects mean a shopper can be blocked at almost every stage of the funnel: adding the wrong (or right, but affected) product, correcting a mistake in the cart, and finally submitting the order. This is the top priority for a fix-and-retest cycle before any further testing or release discussion.

6. Risk Assessment and Recommendation

Release Recommendation: NOT READY. With 4 High-severity, purchase-blocking defects still Open and zero defects yet fixed or retested, the application does not meet a reasonable quality bar for release in its current state.

- Immediate: Fix and retest all High-severity defects (SWG_BUG_001, 002, 003, 007) — these block the core add-to-cart and checkout-completion flows.
- Next: Address Medium-severity defects affecting validation and navigation correctness (SWG_BUG_004, 005, 008), since they allow invalid states (empty cart at checkout, missing required field) to pass silently.
- Then: Fix the Low-severity navigation defect (SWG_BUG_006) as a minor UX correction.
- Run a full regression pass over the affected modules (Product Listing, Product Detail, Checkout Info, Cart) after fixes land, not just a retest of the individual failed cases, since Add to Cart and Checkout are shared dependencies across the suite.

7. Conclusion

This cycle executed 44 test cases and surfaced 8 defects, 4 of them High severity and all still Open. The defects are concentrated in the exact modules that make up the core shopping journey, so despite a passing rate of roughly 81.8% on paper, the practical impact is severe: a shopper cannot reliably reach a completed order today. Recommend halting any release planning until the High-severity fixes are verified, followed by a full regression cycle before this report is reissued with updated results.
