

QA Test Summary & Bug Report

XYZ Bank Limited — HR Staff Management System

Capstone Project — Project Group 1 (OrangeHRM)

Field	Detail
Client / System Owner	XYZ Bank Limited
System Under Test	HR Staff Management System (internal bank platform, built on OrangeHRM), used for onboarding, records, performance, and recruitment of bank staff
Prepared For	XYZ Bank Limited — Project Stakeholders
Prepared By	QA Team — Salem, Adetoun, Augustine (Team Lead: Augustine)
Test Environment	OrangeHRM Demo Application (staging environment for XYZ Bank HR system)
Report Date	July 4, 2026

1. Executive Summary

This report summarizes QA testing activity performed on the HR Staff Management System being implemented for XYZ Bank Limited, covering Login/Logout, Dashboard, PIM (employee records), My Info, Performance, and Recruitment modules. Of 40 test cases executed, 33 passed (82.5%) and 7 failed (17.5%). All 7 failures were logged as defects and remain open at the time of this report.

Because this system will hold sensitive staff records for a regulated financial institution, defects that compromise data integrity carry more weight than they would in a typical HR tool. The most significant finding is a recurring pattern: input-validation controls on name and date fields are not consistently enforced across multiple modules (PIM, My Info, Recruitment). This is not a set of isolated bugs but a systemic gap affecting the accuracy and integrity of bank staff records used for payroll, compliance reporting, and audit purposes.

Four defects — INFO_BUG_001, INFO_BUG_002, PIM_BUG_001, and PIM_BUG_002 — are rated High severity. Each allows unvalidated numeric or special-character data into an employee's name or date-of-birth field with no error shown, and in the PIM cases the system still displays a false “Successfully Saved” confirmation. These four defects represent the most severe expression of the validation gap described above and pose the greatest risk to data quality.

Per the QA Test Plan's exit criteria, no Critical or High-severity defects should remain open before this cycle is considered complete. With 4 High-severity defects currently open, exit criteria have not been met, and these defects are recommended for immediate remediation prior to go-live.

Testing was intentionally limited to 40 sampled test cases across 7 in-scope modules; 8 modules (Admin, Leave, Time, Directory, Maintenance, Claim, Buzz, User Profile) were not tested this cycle. This report should be read as a snapshot of quality rather than a full assessment, and additional coverage is recommended before deployment.

2. Test Execution Summary

Metric	Count	% of Total	Notes
Total Test Cases Executed	40	100%	Login, Logout, Dashboard, PIM, My Info, Performance, Recruitment
Passed	33	82.5%	Core happy-path flows are stable
Failed	7	17.5%	All 7 failures logged as defects (Section 4)

3. Defect Overview

A total of 7 defects were identified during this test cycle. All defects are currently Open and assigned to development for remediation.

3.1 Defects by Severity

Severity	Count	% of Defects
High	4	57%
Medium	2	29%

Low	1	14%
Total	7	100%

3.2 Ownership

Owner	Modules	Defects Assigned
Dev 1	PIM, Recruitment	4
Dev 2	Performance, My Info	3

4. Defect Detail

Bug ID	Module	Description	Severity	Status
INFO_BUG_001	My Info	Numeric-only First Name (e.g. "123456") is accepted and saved; no validation error shown.	High	Open
INFO_BUG_002	My Info	Future Date of Birth (2099-01-01) is accepted and saved instead of rejected.	High	Open
PIM_BUG_001	PIM	Numeric characters accepted in First/Middle/Last Name fields when adding an employee, with no validation warning.	High	Open
PIM_BUG_002	PIM	Special-character string (e.g. "\$%^\$#@") accepted in First Name field; profile is saved with a false "Successfully Saved" confirmation instead of a validation block.	High	Open
REC_BUG_001	Recruitment	Duplicate candidate (same name and email) is accepted instead of being flagged or rejected.	Medium	Open
PERF_BUG_001	Performance	Reviewer names are not displayed in the Tracker list after a tracker is saved.	Medium	Open
REC_BUG_002	Recruitment	Numeric characters accepted in candidate First Name field with no validation error.	Low	Open

5. Risk Assessment

As this system will manage employee records for XYZ Bank Limited, the following risks are assessed with banking-sector considerations in mind: regulatory audit readiness, accuracy of records used in payroll/statutory reporting, and the bank's obligation to maintain reliable staff data under its internal controls and applicable financial-sector data governance requirements.

- High risk — Unvalidated name and date-of-birth fields (INFO_BUG_001, INFO_BUG_002, PIM_BUG_001, PIM_BUG_002) can corrupt bank staff records. Incorrect DOB data can misstate retirement/benefits eligibility, and malformed names create mismatches against ID/KYC documentation held elsewhere in the bank's systems — both are the kind of discrepancy internal/external auditors flag during HR audits.
- Medium risk — Lack of duplicate-candidate detection (REC_BUG_001) creates downstream data-quality issues and could allow duplicate profiles into records that feed payroll and staff verification once a candidate becomes staff.
- Medium risk — Reviewer data loss on the Performance Tracker (PERF_BUG_001) undermines the integrity of staff performance appraisals, which at a bank often tie directly into promotion, bonus, and compliance sign-off decisions.
- Low risk — Numeric candidate names (REC_BUG_002) are a data-quality issue with limited functional impact, though any bad data entering the Recruitment module before hire increases downstream clean-up effort once a candidate becomes staff.

6. Recommendations

- Prioritize the fix and re-test of all 4 High-severity defects (INFO_BUG_001, INFO_BUG_002, PIM_BUG_001, PIM_BUG_002) before the next release milestone; these directly affect the reliability of bank staff records and should be treated as go-live blockers.
- Apply a shared, centralized input-validation rule for name and date fields across all modules rather than fixing each module individually, since the same defect pattern recurs in PIM, My Info, and Recruitment.

- Add server-side duplicate-detection logic for Recruitment candidates, not just client-side checks, to prevent duplicate staff profiles once candidates are converted to employees.
- Investigate the Performance Tracker save logic to confirm reviewer data is persisted, not just omitted from the display, given its link to appraisal and compliance sign-off records.
- Schedule a regression pass on all 7 defects once fixes are delivered, and expand test coverage for boundary and negative input cases given the pattern observed.
- Given XYZ Bank Limited's regulatory environment, recommend a follow-up review with the bank's internal audit/compliance and information-security teams before production sign-off, to confirm the fixes satisfy the bank's data-accuracy and record-keeping requirements.

7. Conclusion

The HR Staff Management System demonstrates stable core functionality across authentication, navigation, and primary workflows, with an 82.5% pass rate this cycle. However, the concentration of validation failures around user-entered names and dates — now spanning 4 High-severity defects across PIM and My Info — warrants attention before sign-off, particularly given that XYZ Bank Limited will rely on this system as the system of record for its staff. The QA team recommends addressing all 4 High-severity defects as release blockers, treating the remaining Medium/Low defects as required fixes for the next iteration, and completing a compliance/audit-readiness review prior to production deployment.
